

Termiglass

THE NATURAL SOLUTION

WHAT IS TERMIGLASS

Termiglass is a physical termite management system which is installed to new build properties during the construction process. Termiglass works by preventing termites from entering a home undetected, and forces termites into the open where their mud tubes and workings can be seen.

Termiglass is specially designed to be too hard to chew, too small for termites to crawl through, and too heavy for termites to move. With a durability of over 60 years, Termiglass is the non-toxic, eco-friendly, Termiglass is the natural choice for protecting your new build from termite attack.

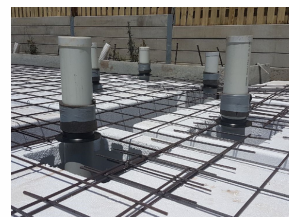

Termiglass is Deemed to Satisfy the ABCB NCC 2019 Volumes One and Two, including amendments.
